

## Introduction

Compliance risk has become one of the most significant ongoing concerns for financial institution executives. Since 2009, regulatory fees have dramatically increased relative to banks' earnings and credit losses (Exhibit 1). Additionally, the scope of regulatory focus continues to expand. Mortgage servicing was a learning opportunity for the US regulators that, following the crisis, resulted in increasingly tight scrutiny across many other areas (e.g., mortgage fulfillment, deposits, cards, etc.). New topics continue to emerge, such as conduct risk, next-generation Bank Secrecy Act and Anti Money Laundering (BSA/AML) risk, risk culture, and third- and fourth-party (i.e., sub-contractors) risk amongst others. Even though a lot of work has been done to respond to immediate pressures, the industry needs a more structural answer that will allow banks to effectively and efficiently mature their risk and control frameworks to make them more robust and sustainable over time.

The traditional compliance model was designed in a different era and with a different purpose in mind, largely as an enforcement arm for the legal function. Compliance organizations used to promulgate regulations and internal bank policy largely in an advisory capacity with a limited focus on actual risk identification and management. However, this model has offered a limited understanding of the business operations and underlying risk exposures, as well as of how to practically translate regulatory requirements into management actions. Even if a compliance testing program was established, it frequently borrowed heavily from the late 20th-century operational risk playbook by emphasizing a bottom-up, subjective process of control testing vs. a more objective, risk-based monitoring of material residual risks. Frequently, business managers are left to their own devices to figure out what specific controls are required to address regulatory requirements, typically leading to a build-up of labor-intensive control activities with uncertain effectiveness. Many banks still struggle with the fundamental issues of the control environment in the first line of defense such as compliance literacy, accountability, performance incentives, and risk culture. Finally, compliance activities tend to be isolated, lacking a clear link to the broader Risk Management framework, governance, and processes (e.g., Operational Risk Management, risk appetite statement, risk reporting and analytics, etc.). More often than not, the net result is primarily a dramatic increase in compliance and control spend with either limited or unproved impact on the residual risk profile of a bank.

An emerging best practice model for compliance in banking needs to rely on three core principles to address these challenges.

# 1. An expanded role of compliance and active ownership of the risk and control framework

In most cases banks need to transform the role of their Compliance departments from that of an advisor to one that puts more emphasis on active risk management and monitoring. In practice it means expanding beyond offering advice on statutory rules, regulations, and laws and becoming an active co-owner of risks to provide an independent oversight of the control framework.

Given this evolution, responsibilities of the compliance function are expanding rapidly to include:

- Generating practical perspectives on the applicability of laws, rules, and regulations across businesses and processes and how they translate into operational requirements (Exhibit 2)
- Creating standards for risk materiality (e.g., definition of material risk, tolerance levels, tie to risk appetite, etc.)
- Developing and managing a robust risk identification and assessment process/toolkit (e.g., comprehensive inventory of risks, objective risk assessment scorecards, risk measurement methodology etc.)
- Developing and enforcing standards for an effective risk remediation process (e.g., root cause analysis, performance tracking, etc.) to ensure it addresses root causes of compliance issues rather than just "treating the symptoms"
- Establishing standards for training programs and incentives tailored to the realities of each type of job or work environment

- Ensuring that the frontline effectively applies processes and tools that have been developed by compliance
- Approving clients, transactions, and products based on predefined risk-based rules
- Performing a regular assessment of the state of the overall compliance program
- Understanding the bank's risk culture and its strengths as well as potential shortcomings

Risk culture has a special place in the compliance playbook. Indeed, most serious failures across financial institutions in recent times have a cultural root cause leading to heightened regulatory expectations. Elements of "strong" risk culture are relatively clear (albeit not always explicitly articulated) and include timely information sharing, rapid elevation of emerging risks, and willingness to challenge practices; however, they are difficult to measure objectively. Use of tools such as structured risk culture surveys can allow for a deeper understanding of nuances of risk culture across the organization and their results can be benchmarked against peer institutions to reveal critical gaps. Consequently risk culture can be actively shaped, monitored, and sustained by committed leaders and organizations.

Effective execution of these expanded responsibilities requires a much deeper understanding of the business processes by Compliance. There are a few practical ways to achieve this, including:

- Incorporating process walkthroughs into the regular enterprise compliance risk assessments (e.g., facilitated workshops with first line and second line to assess inherent risk exposures and how they affect business processes)
- Implementing a formal business change management process that flags any significant operational changes (e.g., volumes, products, workflows, footprint, and systems) to the second line
- Developing a robust toolkit for objectively measuring risk (e.g., quantitative measurement for measurable risks, risk markers for risks harder to quantify, common inventory of risky outcomes, scenario analysis and forward-looking assessments, etc.)

Finally, the design of the Compliance function's operating model is becoming increasingly important. Thus, it demands a shift from a siloed, Business Unit-based coverage to a model where Business Unit-coverage is combined with horizontal expertise around key compliance areas, such as BSA/AML, UDAAP, mortgage (across all mortgage businesses), third-party and others.

## 2. Transparency into residual risk exposure and control effectiveness

One of the traditional industry practices for the second line's engagement with the business has been to identify "high-risk processes" and then to identify "all the risks" and "all the controls" that pertain to each of them. This approach, however, falls short of creating a real and comprehensive transparency into material risk exposures and often becomes a merely mechanical exercise.

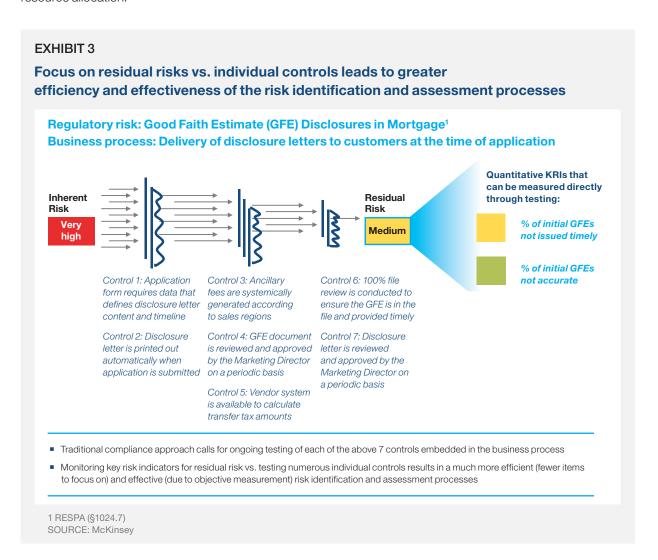

First, the lack of an objective and clear definition of a "high-risk process" frequently leaves this decision to the discretion of business lines, which can lead to the omission of risks that are critical from a compliance risk standpoint but deemed less significant from a business standpoint (e.g., a low-volume collections process can seem an insignificant part of the overall business portfolio but can be a critical area for regulatory compliance). This approach also suffers from inconsistencies. As an example, an account opening process may be deemed high-risk in some retail units but not in others.

Second, the pursuit of documenting virtually "all risks" and "all controls" implies a significant amount of work and actually limits first line's ability to go deep on issues that truly matter, producing lengthy qualitative inventories of risks and controls instead of identifying material risk exposures and analyzing the corresponding process and control breakpoints and root causes.

The new approach focused on residual risk exposures and critical process breakpoints ensures that no material risk is left unattended and provides the basis for truly risk-based, efficient oversight and remediation activities. It addresses these challenges by directly tying regulatory requirements to processes and controls (i.e., through the mapping of risks to products and processes), by cascading material risks down to the frontline in a systematic and truly risk-based way, and by defining objective (and whenever possible quantitative) Key Risk Indicators (KRIs) in the areas where the process "breaks" and creates exposure to a particular risk.

Thus, as exhibit 3 illustrates, there are typically numerous controls associated with every regulatory requirement throughout a given business process. Testing all of these controls consumes tremendous organizational time and resources. Each control is documented and its level of effectiveness qualitatively assessed (although the definition of "effectiveness" is often ambiguous and varies from person to person). Unfortunately, the overall control effectiveness score resulting from this exercise is only loosely correlated with the outcome – it's not unusual to see critical audit findings in areas where the majority of controls have been deemed effective.

In contrast, the new approach starts by defining which risks apply to a given business process and identifying where exactly in the process they occur (known as "breakpoint analysis"). Informed by the identified process breakpoints, one can then design KRIs that directly measure the residual risk exposure. This approach leads to far fewer items to test (in our example 2 KRIs vs. 7 controls) and much more robust insights into what the key issues are. Moreover, it provides the essential fact base to guide and accelerate the remediation process and resource allocation.

## 3. Integration with the overall Risk Management governance, regulatory affairs and issue management process

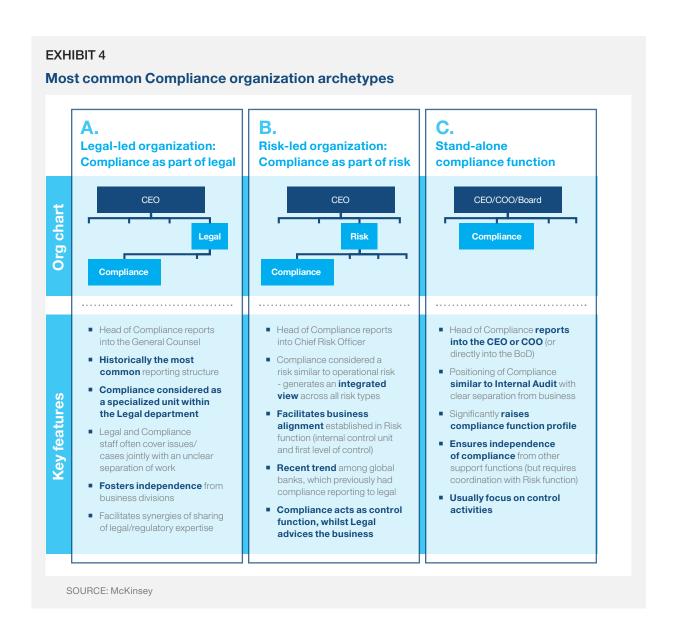

Compliance risks are driven by the same underlying factors that drive other banking risks, but their stakes are higher in the case of adverse outcomes (e.g., regulatory actions that can result in restriction of business activities and large fines). Therefore it's only fitting that a modern compliance framework needs to be fully integrated with the bank's operational risk view of the world.

Integrating the management of these risks offers tangible benefits. First, it ensures the enterprise has a truly comprehensive view of its portfolio of risks and visibility into any systemic issues (e.g., cross-product, cross-process), and that no material risk is left unattended. Second, it lessens the burden on the business (e.g., no duplicative risk assessments and remediation activities) as well as on the control functions (e.g., no separate or duplicative reporting, training, and communication activities). Third, it facilitates a risk-based allocation of enterprise resources and management actions on risk remediation and investment in cross-cutting controls.

The following practical actions can help the bank firmly integrate Compliance into the overall Risk Management governance, regulatory affairs, and issue management process:

- Develop a single integrated inventory of operational and compliance risks
- Develop and centrally maintain standardized risk, process, product, and control taxonomies
- Coordinate risk assessment, remediation, and reporting methodologies and calendars (e.g., ensure one set of assessments in cross-cutting topical areas like Third-Party Risk Management; ensure consistency of Compliance monitoring and testing activities with QA/QC activities in Operational Risk)
- Define clear roles and responsibilities between risk and control functions at the individual risk level to ensure there are no gaps or overlaps, particularly in "grey areas" where disciplines converge (e.g., Third-Party Risk Management; Privacy Risk; AML and Fraud)
- Develop and jointly manage integrated training and communication programs
- Establish clear governance processes (e.g., escalation) and structures (e.g., risk committees) with mandates that span across risk and support functions (e.g., Technology), and that ensure sufficient accountability, ownership, and involvement from all stakeholders, even if issues cut across multiple functions
- Consistently involve and timely align senior Compliance stakeholders in determining action plans, target end dates, prioritization of issues and MRAs
- Establish a formal link and coordination processes with government affairs

To address this integration effectively, financial institutions are also considering changes to the organizational structure and placement of the Compliance function. Exhibit 4 lays out the three archetypes of Compliance organizations in banks. Migration of Compliance to Risk organization (i.e., archetype B) is a recent trend among global banks, which previously had Compliance reporting to Legal (i.e., archetype A). This new structure reinforces the view of Compliance as a risk similar to operational risk and as a control rather than advisory function, and is meant to facilitate an integrated view across all risk types. A few banking institutions have elevated Compliance to a standalone function (i.e., archetype C) positioning it similar to Internal Audit, with clear separation from business, thus significantly raising its profile but also creating the need for stronger coordination with the operational risk function.

## Measuring progress – outcomes that matter

The three principles outlined above imply a multi-faceted transformation of the Compliance function. The scope and complexity of this transformation creates a real risk of "missing the forest for the trees." We have found it helpful to apply the following 10-point scorecard to measure progress on this journey:

- 1. Demonstrated focus on the role of compliance and its stature within the organization
- 2. Integrated view of market risks with Operational risk
- 3. Clear tone from the top and strong risk culture, including evidence of senior management involvement and active board oversight
- 4. Risk ownership and independent challenge by Compliance (vs. "advice and counsel")
- **5.** Compliance operating model with shared horizontal coverage of key issues and a clear definition of roles vs. the first line of defense
- **6.** Comprehensive inventory of all laws, rules, and regulations in place to drive a risk-based compliance risk assessment program
- 7. Use of quantitative metrics and specific qualitative risk markers to measure compliance risk
- 8. Compliance MIS providing an integrated view of risks and reflecting a common risk taxonomy
- 9. Evidence of the first line of defense taking action and owning compliance and control issues
- **10.** Adequate talent and capabilities to tackle key risk areas (e.g., BSA/AML, fiduciary risk) and a working knowledge of core business processes (e.g., mortgage servicing).

Assuming one point for each of these requirements, a bank with a low score (e.g., 4 to 5 points) may require a significant transformation. Banks can maximize the impact of the transformation by rigorously measuring progress against desired outcomes. Audit should play an important role in this process, providing an independent view of program status and effectiveness with respect to commonly agreed transformation objectives.

. . .

Regulatory compliance has undoubtedly affected banks in a variety of challenging ways, increasing the cost of service and sometimes making the delivery of great customer experience more difficult. However, as the regulatory environment evolves, we see a major opportunity for the Compliance function to get ahead of the curve by implementing targeted changes to its operating model and processes, and thus delivering a better quality of oversight while at the same time increasing its efficiency. Banks that successfully make this shift will enjoy a distinctive source of competitive advantage in the foreseeable future, being able to deliver better service, reduce structural cost, and significantly de-risk their operations.

## McKinsey Working Papers on Risk

The risk revolution
 Kevin Buehler, Andrew Freeman, and Ron Hulme

Making risk management a value-added function in the boardroom

André Brodeur and Gunnar Pritsch

Incorporating risk and flexibility in manufacturing footprint decisions

Eric Lamarre, Martin Pergler, and Gregory Vainberg

4. Liquidity: Managing an undervalued resource in banking after the crisis of 2007–08

Alberto Alvarez, Claudio Fabiani, Andrew Freeman, Matthias Hauser, Thomas Poppensieker, and Anthony Santomero

5. Turning risk management into a true competitive advantage: Lessons from the recent crisis

Andrew Freeman, Gunnar Pritsch, and Uwe Stegemann

 Probabilistic modeling as an exploratory decisionmaking tool

Andrew Freeman and Martin Pergler

 Option games: Filling the hole in the valuation toolkit for strategic investment

Nelson Ferreira, Jayanti Kar, and Lenos Trigeorgis

8. Shaping strategy in a highly uncertain macroeconomic environment

Natalie Davis, Stephan Görner, and Ezra Greenberg

9. **Upgrading your risk assessment for uncertain times** Eric Lamarre and Martin Pergler

 Responding to the variable annuity crisis
 Dinesh Chopra, Onur Erzan, Guillaume de Gantes, Leo Grepin, and Chad Slawner

 Best practices for estimating credit economic capital Tobias Baer, Venkata Krishna Kishore, and Akbar N. Sheriff

12. Bad banks: Finding the right exit from the financial

Gabriel Brennan, Martin Fest, Matthias Heuser, Luca Martini, Thomas Poppensieker, Sebastian Schneider, Uwe Stegemann, and Eckart Windhagen

13. **Developing a postcrisis funding strategy for banks**Arno Gerken, Matthias Heuser, and Thomas Kuhnt

14. The National Credit Bureau: A key enabler of financial infrastructure and lending in developing economies Tobias Baer, Massimo Carassinu, Andrea Del Miglio, Claudio Fabiani, and Edoardo Ginevra

15. Capital ratios and financial distress: Lessons from the crisis

Kevin Buehler, Christopher Mazingo, and Hamid Samandari

16. Taking control of organizational risk culture Eric Lamarre, Cindy Levy, and James Twining

17. After black swans and red ink: How institutional investors can rethink risk management Leo Grepin, Jonathan Tétrault, and Greg Vainberg

A board perspective on enterprise risk management

André Brodeur, Kevin Buehler, Michael Patsalos-Fox, and Martin Pergler

19. Variable annuities in Europe after the crisis: Blockbuster or niche product?

Lukas Junker and Sirus Ramezani

20. Getting to grips with counterparty risk

Nils Beier, Holger Harreis, Thomas Poppensieker, Dirk Sojka, and Mario Thaten

21. Credit underwriting after the crisis

Daniel Becker, Holger Harreis, Stefano E. Manzonetto, Marco Piccitto, and Michal Skalsky

22. Top-down ERM: A pragmatic approach to manage risk from the C-suite

André Brodeur and Martin Pergler

23. Getting risk ownership right

Arno Gerken, Nils Hoffmann, Andreas Kremer, Uwe Stegemann, and Gabriele Vigo

24. The use of economic capital in performance management for banks: A perspective

Tobias Baer, Amit Mehta, and Hamid Samandari

25. Assessing and addressing the implications of new financial regulations for the US banking industry Del Anderson, Kevin Buehler, Rob Ceske, Benjamin Ellis, Hamid Samandari, and Greg Wilson

26. Basel III and European banking: Its impact, how banks might respond, and the challenges of implementation Philipp Härle, Erik Lüders, Theo Pepanides, Sonja Pfetsch,

Philipp Härle, Erik Lüders, Theo Pepanides, Sonja Pfetsch, Thomas Poppensieker, and Uwe Stegemann

27. Mastering ICAAP: Achieving excellence in the new world of scarce capital

Sonja Pfetsch, Thomas Poppensieker, Sebastian Schneider, and Diana Serova

28. Strengthening risk management in the US public sector Stephan Braig, Biniam Gebre, and Andrew Sellgren

29. Day of reckoning? New regulation and its impact on capital markets businesses
